Agenda

15:30	Registration, coffee & mingling	
16:00	Welcome, Key takeaways and announcements from Microsoft Build 2026	David Pazdera
16:30	Entra ID Agent Samples - Idea to Production-Ready Agent in Seconds on AI-native Runtime	Jan Vidar Elven
17:30	Vibecoding with Squad	Anders Kristiansen & Haflidi Fridthjofsson
18:30	Hands-on lab session: 'From zero to deployed on Azure with AI agents'	Craig Forshaw

Key takeaways and announcements from Microsoft Build 2026

David Pazdera

**Bummer:
No Book of News**

**Build CLI to the
rescue**

<https://github.com/microsoft/Build-CLI>

```
/plugin install microsoft/Build-CLI  
/restart
```

```
/plugin marketplace add microsoft/Build-CLI  
/plugin install microsoft-events@microsoft-events-marketplace
```

Build-CLI targets **Build 2026** and also indexes past events (Build 2025, Ignite 2025)

Prompt

Create an overview of interesting Microsoft Build 2026 announcements that would target **IT Pros and Security professionals**. In the overview, include not just the title and a short description, but also a link to more details (like a link to TechCommunity or other technical blogs). Use microsoft-build skill.

Description:

Your companion for Microsoft Build 2026. Helps you find sessions relevant to your project, discover what's new for your tech stack, scaffold projects from sessions, and plan your event schedule. Activate when users mention sessions, schedule, what's new, Build, Ignite, AI Tour, Microsoft event, conference, or reference a session code (BRK, DEM, LAB, KEY). Also supports Ignite 2025 and Build 2025 session catalogs. Uses the msevents CLI for fast local search and Learn MCP Server for docs.

Allowed Tools: microsoft_docs_search microsoft_docs_fetch microsoft_code_sample_search

~

Create an overview of interesting Microsoft Build 2026 announcements that would target IT Pros and Security professionals. The plan is to present this overview in a 30-minute session to a technical audience. In the overview, include not just the title and a short description, but also a link to more details (like a link to TechCommunity or other technical blogs). Use microsoft-build skill._

Why businesses

Session: 0 AIC used
The AI Decision NB-NO-EB

MDASH: Agentic Vulnerability Scanning & Discovery

Microsoft's new **multi-model** agentic scanning harness (codename MDASH) orchestrates 100+ specialized AI agents to discover, validate, and prove exploitability across codebases. Now integrated with Microsoft Defender and GitHub Code Security (GA), runtime signals like internet exposure and data sensitivity automatically prioritize findings — and Copilot Autofix remediates them in-workflow.

Codebase scanner (standalone CLI) that can run inside workflows. Behind the scenes, MDASH **orchestrates over 100 specialized agents** discover, debate, and prove exploitable vulnerabilities. Outputs SARIF and HTML reports + integrate with GHAS.

Agent 365: Govern Every AI Agent in Your Tenant including local agents, claws, and open runtimes

Intelligent agents run locally on devices, interact directly with sensitive data, apps, and systems → new **risk surface** for organizations

A365 control plane extends to local agents (endpoints) to battle “shadow AI”.

- A365 Agent Registry – shows
- Defender discovers local agents, adds runtime protection (block unsafe actions)
- Purview extends enforcement of DLP policies to local agents
- Entra extends its SASE architecture to local agents, enforces network-based security controls at runtime
- Intune governs execution through device policies

Azure Infrastructure Resiliency Manager (Preview)

AIRM is not a replacement for individual resiliency features; it is the unifying layer that connects them into a goal-driven workflow.

It complements Azs, Advisor, Chaos Studio, AzMon, and Azure Copilot.

New **Resiliency Agent** for architects and developers, allows teams to validate and refine resiliency strategies. It can accelerate implementation by generating IaC templates (Bicep, TF, ARM) with all resiliency config pre-built.

Use Service Groups to define your apps across subs, RGs, regions and assign a **resiliency goal**.

<https://techcommunity.microsoft.com/blog/reliability-and-resiliency-in-azure/announcing-azure-infrastructure-resiliency-manager-public-preview/4523710>

MDfC + GitHub Code Security native integration (GA)

The Microsoft Defender for Cloud and GitHub Code Security native integration **brings runtime context to vulnerability detections** that developers already see in their pull requests, so both teams can prioritize what's exploitable and remediate inside the same workflow. *Visibility from code to runtime!*

- Real-time visibility across the app lifecycle. SecOps can track vulnerabilities status detected by GH Code Security in MDfC. A security campaign alerts GH repo owners
- Critical alert prioritization by connecting runtime context to code
- Remediation time reduction with AI-suggested with Copilot Autofix and GHC cloud agent
- Defender correlates data from source code, container image scans, and live environment

Microsoft Scout: The First "Autopilot" Agent

Scout is Microsoft's first always-on **personal autonomous agent** ("Autopilot"), working on your behalf. Built on OpenClaw and WorkIQ, it monitors Teams, Outlook, OneDrive, and SharePoint, and proactively handles meeting prep, scheduling conflicts, and routine tasks without prompting. It runs with its own Entra identity, subject to the same governance controls (e.g., Purview data protection policies) as any managed workload.

Fun fact: the internal name was *Project Lobster*

 aguidetocloud.com – Build 2026 Full AI Recap

Scout

Microsoft IQ

with Web IQ (Preview) and Foundry IQ (GA)

- New **context layer** that grounds agents in both world knowledge and enterprise knowledge
- Work IQ (GA) is the workplace intelligence layer for agents (not just M365 Copilot)
- Fabric IQ provides a shared semantic foundation over structured business data.
- Foundry IQ ties it together and enables retrieval planning across both enterprise knowledge and the live web.
- Web IQ - An AI-first web search stack that's model-agnostic and MCP-native.

Azure Cobalt 200 VMs: 50% Faster, Built for Agents

Azure Cobalt 200 ARM-based VMs are in early access preview across 8+ regions (West US3, East US2, Central US, Sweden Central, and more). Designed from silicon up for cloud-native and agentic workloads, they deliver up to 50% better generational performance over Cobalt 100. Built-in compression and cryptography accelerators benefit database and AI inference workloads. Consumption-pricing makes them attractive for variable agent workloads.

AZURE INFRASTRUCTURE

Windows 365 for Agents: Managed Cloud PCs for AI Workflows

Windows 365 for Agents gives enterprise AI agents dedicated, Entra-joined, Intune-managed Cloud PCs — complete with policy enforcement and compliance controls. Agents can interact with legacy apps, internal portals, and UI-based workflows that lack clean APIs. Each Cloud PC runs within your existing security perimeter. Consumption-based pricing; try 50 free hours via Copilot Studio. Already powering Microsoft's own Researcher and Project Opal.

AZURE INFRASTRUCTURE

Azure HorizonDB: PostgreSQL Built for Agentic Apps

Azure HorizonDB is a fully managed PostgreSQL service engineered for the demands of agentic applications: ultra-low latency, read scale-out, up to 3x faster transactions and search performance, advanced vector indexing, semantic search, and in-database model access. Native integrations with Microsoft Fabric and Foundry make it the natural backing store for agent memory and retrieval pipelines. Currently in preview.

<https://www.youtube.com/watch?v=ZsLnWnjkJQw>

Foundry Local + Azure Local: Sovereign AI On-Premises (Preview)

Microsoft Foundry Local now runs on Azure Local (on-premises), letting organizations build, deploy, and govern AI agents entirely within their own data center boundary — no data leaving the perimeter. Foundry Local also ships as a free desktop app (preview) for individual researchers requiring a GitHub Copilot account. For regulated industries and sovereign cloud requirements, this is the path to enterprise-grade AI without cloud data residency concerns.

Azure Container Linux (ACL) – immutable, container optimized host on AKS (GA)

Builds on Flatcar Container Linux ecosystem (foundation for secure, minimal, and container-optimized OS).

- Reduces config drift, minimizes attack surface, and simplifies lifecycle management.
- ACL integrates Azure Linux binaries as the core foundation with enterprise-hardened security.
- Read-only /usr filesystem + minimal package set (reducing CVE exposure) + mandatory access control with SELinux + Trusted Launch using UKI + signed Azure Linux RPMs

```
az aks create --os-sku  
AzureContainerLinux
```

CONTAINERS - SECURITY

MICROSOFT BUILD 2026

Episode XXVI

THE AGENTIC ERA

AI alone won't change your business.
The system running it will...

Seven new MAI models launched — climbing the hill toward frontier AI.

Majorana 2, the next-gen quantum chip: 1,000x more reliable, with a path to one million qubits.

A scalable quantum machine by 2029.

Confidential Live Migration in Azure

Azure Container Apps Sandboxes for agentic workloads

Microsoft Foundry leveled up — hosted agents. Memory. Toolboxes.
