Agenda

Why agents break between demo and production

Live demo: Code to production-ready agent in seconds

How Azure Container Apps delivers the agent runtime

Customer spotlight: Auger's autonomous supply chain on Azure

Not because the models can't reason. Because the runtime can't keep up.

Five Places The Runtime Breaks

Budgets
that burn
unattended

Untrusted
code on a
developer's
laptop

Cold starts that
throttle the
loop

Workspaces
that die on
every restart

Tooling stitched
together by
hand

Five Things The Runtime Has To Do

**Fast startup
and resume**

Agents remain
responsive and
reliable

**Execute agent
tool calling**

And untrusted
code, safely

**Persist and
restore state**

Support
long-running agent
workflows

**Strong isolation
per agent task**

Prevent cross-task
data leakage

**Secure by
default**

Enforced at the
runtime boundary

Summary

One platform for apps, MCP tools, and ephemeral compute

Sub-second cold start	→	Express & Sandbox prewarmed pools
Strong per-task isolation		Code execution in Sandbox
Persistent agent workspace		Sandbox snapshots
Massive burst		Auto scale-out to thousands of concurrent sandboxes
Cost effective		Scale to zero when idle
GPU on demand		Serverless GPUs for inferencing
Zero infra decisions		Opinionated defaults with Express

One platform for apps, MCP tools, and ephemeral compute

Introducing in Public Preview

Azure Container Apps Sandboxes

Fast, isolated and stateful compute infrastructure on demand

Execute Securely by Default

Sandbox isolation for any
untrusted workload

Resume Instantly

Preserve every interaction with trusted
enterprise controls

Burst to hyperscale

Spin up in sub-second time, scale from zero to
thousands, pay nothing when idle

Foundation layer for

aka.ms/aca/sandboxes

Use Cases for Sandboxes

Agent Workflows

Give AI agents persistent, isolated workspaces that survive across task boundaries

AI Code Execution

Safely run LLM-generated code in isolated environments with instant startup

Platform Building

Build your own platforms on top of the same primitive powering Microsoft services

Burst Workloads

Scale from zero to thousands of sandboxes in response to demand

Secure Multi-Tenant Compute

Strong isolation guarantees for running untrusted workloads from multiple tenants

Interactive User Sessions

Provide each user with their own isolated compute environment

Entra Agent ID Samples

Entra Agent ID Samples

[microsoft/entra-agentid-samples](https://microsoft.com/entra-agentid-samples)

Microsoft Entra Agent ID

Secure access for AI agents - just as you do for employees - with enterprise-grade access management, protection, and governance of agent identities.

Entra Agent ID – where do Agents come from?

Users of Microsoft Agent Platforms

- Copilot Studio
- Azure Foundry
- Security Copilot

Administrators or Developers

- Entra Admin Center
- Microsoft Graph
- PowerShell SDK
- CLI

Users (Administrators)

- 3. Party Agents

Agent Identity Blueprint

Developer/Admin Platforms

Agent Platforms

- Authentication
- Permissions
- Security
- Lifecycle
- AgentIdentity.CreateAsManager

Key Takeaways

- 1 Azure Container Apps delivers a cohesive agent runtime today – Apps, Sandboxes, Express, and serverless GPUs.
- 2 Azure Container Apps Sandboxes are in public preview – fast, isolated, stateful compute to untrusted code securely by default.
- 3 Proven in production today – GitHub Copilot, Foundry Agent Service, SitecoreAI, EdChat, Auger and more.
